

## ABSTRACT OF THE DISCLOSURE

A flexible sheath is attached to an end of a rigid extension tube. The other end of the rigid extension tube is connected with a surgical handpiece. Two flexible sheaths may be used -- one as a barrier against contamination of aspiration tubing and the other as a barrier against contamination of irrigation tubing. This is effected by securing two rigid extension tubes between the surgical handpiece and an associated one of the aspiration and irrigation tubings. Each flexible sheath is collapsible and expandable so they may be expanded from a collapsed condition over the associated aspiration or irrigation tubings and secured in the expanded condition. The aspiration and/or irrigation tubings are connected to a cassette of a surgical pack.
